Grass varieties have inherent value in withstanding the extremes of drought and excess rain and are relatively pest and diseases free. A concrete idea for construction

On the occasion of Concrete Day, NAGESH PUTTASSAMY looks into the basic paramount mixture so vital in construction

Concrete is a construction material for construction and repair of all types of roads and other constructions. The material was the ash that came out of the basic fire, which was used as binding material. Besides concrete, sand, water and broken stones are also used in construction work. Concrete is considered as the most essential material for building a home, office or any other structure. The raw material cement is used in the mixture. Cement powder when mixed with water and sand gives us concrete. Concrete is concrete, which can be mixed in a few minutes.
